rutgers computer science ranking: *Databases, Information Systems, and Peer-to-Peer Computing* Wee Siong Ng, Beng Chin Ooi, Aris Ouksel, Claudio Sartori, 2005-02-25 Peer-to-peer (P2P) computing promises to o?er exciting new possibilities in d- tributed information processing and database technologies. The realization of this promise lies fundamentally in the availability of enhanced services such as structured ways for classifying and registering shared information, veri?cation and certi?cation of information, content-distributed schemes and quality of c- tent, security features, information discovery and accessibility, interoperation and composition of active information services, and ?nally market-based me- anisms to allow cooperative and non-cooperative information exchanges. The P2P paradigm lends itself to constructing large-scale complex, adaptive, - tonomous and heterogeneous database and information systems, endowed with clearly speci?ed and di?erential capabilities to negotiate, bargain, coordinate, and self-organize the information exchanges in large-scale networks. This vision will have a radical impact on the structure of complex organizations (business, scienti?c, or otherwise) and on the emergence and the formation of social c- munities, and on how the information is organized and processed. The P2P information paradigm naturally encompasses static and wireless connectivity, and static and mobile architectures. Wireless connectivity c- bined with the increasingly small and powerful mobile devices and sensors pose new challenges to as well as opportunities for the database community. Inf- mation becomes ubiquitous, highly distributed and accessible anywhere and at any time over highly dynamic, unstable networks with very severe constraints on the information management and processing capabilities.

rutgers computer science ranking: *Kolmogorov Complexity and Computational Complexity* Osamu Watanabe, 2012-12-06 The mathematical theory of computation has given rise to two important ap proaches to the informal notion of complexity: Kolmogorov complexity, usu ally a complexity measure for a single object such as a string, a sequence etc., measures the amount of information necessary to describe the object. Compu tational complexity, usually a complexity measure for a set of objects, measures the compuational resources necessary to recognize or produce elements of the set. The relation between these two complexity measures has been considered for more than two decades, and may interesting and deep observations have been obtained. In March 1990, the Symposium on Theory and Application of Minimal Length Encoding was held at Stanford University as a part of the AAAI 1990 Spring Symposium Series. Some sessions of the symposium were dedicated to Kolmogorov complexity and its relations to the computational complexity the ory, and excellent expository talks were given there. Feeling that, due to the importance of the material, some way should be found to share these talks with researchers in the computer science community, I asked the speakers of those sessions to write survey papers based on

their talks in the symposium. In response, five speakers from the sessions contributed the papers which appear in this book.

rutgers computer science ranking: Phonological Explorations Bert Botma, Roland Noske, 2012-10-30 The 16 papers contained in this volume address a variety of phonological topics from different theoretical perspectives. Combined, they provide an excellent showcase for the diversity of the field. Topics considered include the place of allomorphy in grammar; Dutch clippings; the status of recursion in phonology; the role of contrast preservation in the Grimm-Verner push chain; the phonological specification of Dutch ‘tense’ and ‘lax’ monophthongs; the distribution of English vowels in a Strict CV framework; a dependency-based analysis of Germanic vowel shifts; a Radical CV Phonology approach to vowel harmony; emergentist vs. universalist perspectives on frequency effects in vowel harmony; the representation of Limburgian tonal accents; durational enhancement in Maastricht Limburguish high vowels; constraint conjunction in Mandarin Chinese; lexical tone association in Harmonic Serialism; a constraint-based account of the McGurk effect; a case study of the acquisition of liquids in early L1 Dutch; and the learnability of segmentation in Tibetan numerals.

rutgers computer science ranking: Optimality Theory Rene Kager, 1999-06-28 This is an introduction to Optimality Theory, whose central idea is that surface forms of language reflect resolutions of conflicts between competing constraints. A surface form is 'optimal' if it incurs the least serious violations of a set of constraints, taking into account their hierarchical ranking. Languages differ in the ranking of constraints; and any violations must be minimal. The book does

not limit its empirical scope to phonological phenomena, but also contains chapters on the learnability of OT grammars; OT's implications for syntax; and other issues such as opacity. It also reviews in detail a selection of the considerable research output which OT has already produced. Exercises accompany chapters 1-7, and there are sections on further reading. Optimality Theory will be welcomed by any linguist with a basic knowledge of derivational Generative Phonology.

rutgers computer science ranking: *Human Perception of Visual Information* Bogdan Ionescu, Wilma A. Bainbridge, Naila Murray, 2022-01-01 Recent years have witnessed important advancements in our understanding of the psychological underpinnings of subjective properties of visual information, such as aesthetics, memorability, or induced emotions. Concurrently, computational models of objective visual properties such as semantic labelling and geometric relationships have made significant breakthroughs using the latest achievements in machine learning and large-scale data collection. There has also been limited but important work exploiting these breakthroughs to improve computational modelling of subjective visual properties. The time is ripe to explore how advances in both of these fields of study can be mutually enriching and lead to further progress. This book combines perspectives from psychology and machine learning to showcase a new, unified understanding of how images and videos influence high-level visual perception - particularly interestingness, affective values and emotions, aesthetic values, memorability, novelty, complexity, visual composition and stylistic attributes, and creativity. These human-based metrics are interesting for a very broad range of current applications, ranging from content retrieval and search, storytelling, to targeted advertising, education and learning, and content filtering. Work already exists in the literature that studies the psychological aspects of these notions or investigates potential correlations between two or more of these human concepts. Attempts at building computational models capable of predicting such notions can also be found, using state-of-the-art machine learning techniques. Nevertheless their performance proves that there is still room for improvement, as the tasks are by nature highly challenging and multifaceted, requiring thought on both the psychological implications of the human concepts, as well as their translation to machines.

Each submission was carefully reviewed by three members of the p- gram committee. Among the 386 submitted papers, 60 regular papers, 24 short papers, 15 poster papers, and 3 industrial papers were selected to be included in the proceedings. The selected papers cover a wide range of topics including Web services, Web intelligence, Web personalization, Web query processing, Web - ching, Web mining, text mining, data mining and knowledge discovery, XML database and query processing, work?ow management, E-commerce, data - rehousing, P2P systems and applications, Grid computing, and networking. rutgers computer science ranking: Environmental Permits Donna Rona, 2012-12-06 Environmental permits enable regulatory agencies to control the disturbance and degradation of the environment caused by man's activities. Created by governments through legislation, the permit processes are administered by elected officials. Environmental legislation is relatively new as an independent field of the law: the laws themselves are primarily a conglomeration of older legal doctrines from other fields of law, modified and adapted for particular situations (Landau and Rheingold 1971). Like other laws, environmental laws are meant to serve and protect the rights and well-being of the public. However, like other laws, they have created confusion, a proliferation of costly paperwork, and some inequities. Numerous statutes, dealing with most aspects of pollution, exist at every level of government-so many, in fact, that they frequently conflict and overlap. These statutes establish a public policy toward polluters. They also empower the regulatory bodies that issue permits. It would be impossible to compile a list of requirements for each type of permit. Therefore, this book will acquaint the reader with the common aspects of environmental permits: their terminology, components, and application processes. This book covers the permit process from initial agencies/applicant contacts through application parts and procedures, to application approval. Special emphasis has been placed on bringing together copies of laws and lists of agencies as appendices. The appendices give the reader easy access to materials that will help clarify the permit process.
