science world answer key 2023: Differentiating and defining 'exposed' and 'offshore' aquaculture and implications for aquaculture operation, management, costs, and policy Tyler Sclodnick, Kevin Gerald Heasman, Bela H. Buck, 2025-02-17 Ocean based aquaculture has typically occurred in protected coastal environments, however the industry and been expanding into offshore locations over the past few decades. The term "offshore" has been used to broadly define any aquaculture facility that either is spatially far from shore, or exposed to high-energy environments even though these are different situations. In most cases, however, offshore is not used in its primary sense, namely the distance from the coastline. A definition for "offshore" in the context of aquaculture has not been clearly defined and continues to lead to ambiguity and confusion among industry participants, support industries, academics, and regulators. Recent advances in the sector, and a growing need to produce seafood from offshore environments, creates a necessity for research and analysis to define and characterize the environments currently described as "offshore" and create a framework for industry members to understand and describe ocean environments effectively. The research topic seeks to create a framework for describing aquaculture environments in the context of distance from shore and ocean energy, as well as explore how these two parameters impact aquaculture technology, operations, regulation, and economics. Submissions should add to the understanding of offshore or open ocean aquaculture farms specifically in the context of the environment in which they operate. A focus will be on creating definitions for the terms "offshore", "open ocean", and "high-energy" in the context of marine farming such that these terms can be used more effectively in the future.

science world answer key 2023: Chatgpt and Other Generative AI Tools Jochen Kuhn, Stefan Küchemann, Knut Neumann, Martina Rau, 2025-02-17 In the past ten years, applications of generative artificial intelligence (GAI) have found rapidly growing use in medicine, science, and daily life. Large language models (LLMs) opened up new avenues in particular for education. LLMs have been used to create interactive educational content for students, stimulate their curiosity, generate code explanations, and develop assessment questions. Additionally, LLMs been applied for language practice, anxiety alleviation, and feedback provision. In higher education, LLMs have shown potential for assisting in medical exam preparation and clinical decision-making. In school education, LLMs can help teachers with automated evaluation of student responses and respective adaptive feedback. More recently LLM-based applications such as chatGPT have been used to generate teaching materials or assessment tasks across different subjects. The fields' understanding of the effects of the use of LLM-based applications in classroom teaching, however, is still in its infancy. GAI tools may help solving a range of tasks in education, in particular with respect to teachers' and students' and teachers' efforts to generate content. However, it is critical that teachers and students do not overly rely on GAI generated solutions but instead critically assess each solution. Students should furthermore not use GAI tools to avoid investing relevant mental effort to create mental models or, more broadly, build-up competencies.
