Answer: Angular: A full-fledged MVC framework developed by Google. It uses TypeScript and has a steep learning curve with features like dependency injection, two-way data binding, and a comprehensive CLI. React: A library developed by Facebook for building UI components. It uses JavaScript (or TypeScript) and is focused on the view layer, promoting a unidirectional data flow and utilizing a virtual DOM for performance. Web Performance and Accessibility What are some techniques to improve web performance? Answer: Minification and compression of CSS and JavaScript files. Using a Content Delivery Network (CDN). Lazy loading of images and other media. Optimizing images and using responsive images. Reducing the number of HTTP requests. Implementing caching strategies. What are ARIA roles and how do they improve accessibility? Answer: ARIA (Accessible Rich Internet Applications) roles provide additional information to screen readers about the purpose of elements. For example, role=button indicates that an element functions as a button, improving the accessibility experience for users who rely on assistive technologies. Examples include SASS and LESS. They help write more maintainable and scalable CSS. What are some common methods for handling asynchronous operations in JavaScript? Answer: Callbacks: Functions passed as arguments to be executed after the completion of an asynchronous operation. Promises: Objects representing the eventual completion (or failure) of an asynchronous operation and its resulting value. Async/Await: Syntax sugar on top of promises that allows writing asynchronous code in a synchronous manner. Practical Questions How do you ensure cross-browser compatibility for a website? Answer: Use CSS resets/normalizes. Test on multiple browsers and devices regularly. Utilize feature detection libraries like Modernizr. Write clean, standards-compliant code. Use vendor prefixes where necessary. Avoid browser-specific hacks. Describe how you would create a responsive design. Answer: Use a fluid grid layout. Utilize flexible images and media queries. coalition technologies front end developer skills test: *The Angular Tutorial* Adam Morgan, 2018-04-23 Learning a front-end framework is hard. Getting started tutorials cover the basics but you leave thinking, Okay, now how do I build something with this?The truth is, getting started tutorials aren't all that great for beginners. They're demos to highlight as many features as quickly as possible.They're great for showing off what a framework can do. They aren't so great for teaching you how to build web apps.The end result is a basic application that doesn't mimic what it's like building real applications as a front-end developer. You'll work with a mocked API and database. Application architecture isn't covered. Automated testing is skipped altogether.Trust me, I've been there. But those days are over. With *The Angular Tutorial*, you'll learn how to build applications using a real API and database. You'll leverage 3rd party APIs like Zomato, Google Places, and open-source libraries just as you would in a real job.The Angular Tutorial assumes you have no previous knowledge of the Angular framework. It starts at the very beginning.Every piece of code is explained and tested to make you interview ready. You'll begin with an introduction to how web applications work followed by an introduction to Angular to give you a good grasp on the basics. Then you'll learn how to setup a real database and API just as I've done at numerous companies ranging from venture capital, startups, Fortune 500 companies, and digital agencies working with companies like CNN, Turner Broadcasting System, NBC, Mazda, AutoTrader and The Home Depot. After that is a deeper dive into Angular where you'll build a real application with features like a signup page, a login page, a dashboard for authenticated users, and a calendar displaying lunch dates which you can show off on your resume or to your friends. You'll deploy this application to the web using Heroku so the proof of your work will be accessible to anyone. □ Forms - Template-driven forms or reactive forms? Don't worry, both are covered. □ E2E Testing - Fast and easy end-to-end testing of your application with Cypress. □ Unit Testing - Unit test your code with Karma and Jasmine. □ Services - Communicate with a backend using Angular's HttpClient and write your own interceptors. □ Authentication - Secure your application with JSON Web Tokens (JWT). □ Authorization - Learn to restrict sections of your application to authorized users. □ Module Architecture - Create dumb components, feature modules, and learn to break down an application into smaller parts. □ OSS Integration - Why re-invent the wheel? Learn to use open-source libraries to your advantage just as you would on the job. □ API Documentation - Learn how to read API documentation so you have the confidence going forward to work with any API. □ Deployment - Get your application onto the web. Learn how to build and deploy your Angular application to Heroku.
